ABSTRACT:

PURPOSE: To uniform rigidity of each block at the lower side, to improve abrasion resistance, to improve travelling performance and to heighten travelling performance at the time of travelling on the ice road for a plural number of blocks different in capacity forming a block pattern.

CONSTITUTION: A block group consisting of blocks divided by groove parts 11 of a tread part 2 is formed, and the block group includes blocks furnished with a plural number of small holes 14 extending rectangularly from a block surface to another block surface. The small holes are round or made in a straight sided shape more than four sides, the maximum sectional diameter (d) of the small holes is 0.1mm-2mm, depth (l) of the small holes is deeper than 2/3 of difference with rubber thickness H of the block (H-h) and shallower than the depth of the rubber thickness H of the aforementioned block minus 2mm and a pitch (p) between respective centers of the small holes 14, 14 adjacent to each other is 2mm-20mm.

ABSTRACTED-PUB-NO: JP 05077613A

BASIC-ABSTRACT:

In a pneumatic tyre having blocks parted by circumferential and lateral grooves in its tread, some of the blocks have small holes which are at right angles to their block surfaces and have bottoms. The holes are round, or polygons with four or more angles, and the max. dia. (d) of each hole ranges from 0.1-2 mm. The depth of each hole is larger than two-thirds of the difference (H-h) between the thickness (H) of the block rubber from the block surface to the upper surface of the belt layer and the thickness (h) of the rubber from the groove bottom to the upper surface of the belt layer, and is smaller than the thickness (H) minus 2 mm.

Pref. the distance between the centres of each pair of adjacent small holes is ranges from 2-20 mm.

ADVANTAGE - This tyre can improve not only the wear resistance but also the running performance on icy and snowy roads.
